## AI of the Storm: How We Built the Most Powerful Industrial Computer in the U.S. in Three Weeks During a Pandemic

The making of Selene is a tale of systems expertise that's bringing high performance computing to the data center.

August 14, 2020 by [RICK MERRITT](#)

## THE BILLION DOLLAR AI PROBLEM THAT JUST KEEPS SCALING

February 11, 2021 Nicole Hemsoth

There is a new challenge workload on the horizon, one where few can afford to compete. But for those who can, it will spark a rethink in what is possible from even the most powerful traditional supercomputers.

It might sound odd that it can be collected under the banner of language modeling since that invokes speech and text analysis and generation. But emerging workloads and research show how far this is from traditional natural language processing. Over the next several years, language models will likely become far more general purpose, encompassing an unimaginable range of problem types.

## GPT-3: Artificial Intelligence at its Finest

Vishak 5 min read

Just when we thought that no-code platforms are the future, here comes this astounding -sure-to-knock-your-mind-off-the-rocks model that'll probably keep you glued to your seats. We aren't surprised though. This is exactly what happens when Elon Musk and Sam Altman collaborate. Yes you guessed it right, we're talking about OpenAI's new model - GPT-3 (Generative Pretrained Transformer - 3). When OpenAI tweeted this a couple of weeks back, the tech world went nuts.

# GPT-3 has given rise to a new ecosystem

*"300 applications are now using GPT-3"*

## GPT-3 Powers the Next Generation of Apps

Over 300 applications are delivering GPT-3–powered search, conversation, text completion, and other advanced AI features through our API.

March 25, 2021  
6 minute read

[JOIN THE WAITLIST ↗](#)

Nine months since the [launch](#) of our first commercial product, the OpenAI API, more than 300 applications are now using GPT-3, and tens of thousands of developers around the globe are building on our platform. We currently generate an average of 4.5 billion words per day, and continue to scale production traffic.

Given any text prompt like a phrase or a sentence, GPT-3 returns a text completion in natural language. Developers can “program” GPT-3 by showing it just a few examples or “prompts.” We’ve designed the API to be both simple for anyone to use but also flexible enough to make machine learning teams more productive.

## AI LaMDA: our breakthrough conversation technology

El Collins

Senior Research Director  
Published May 18, 2021

We've always had a soft spot for language at Google. Early on, we set out to translate the web. More recently, we've invented machine learning techniques that help us *better grasp the intent of search queries*. Over time, our advances in these and other areas have made it easier and easier to organize and access the heaps of information conveyed by the written and spoken word.

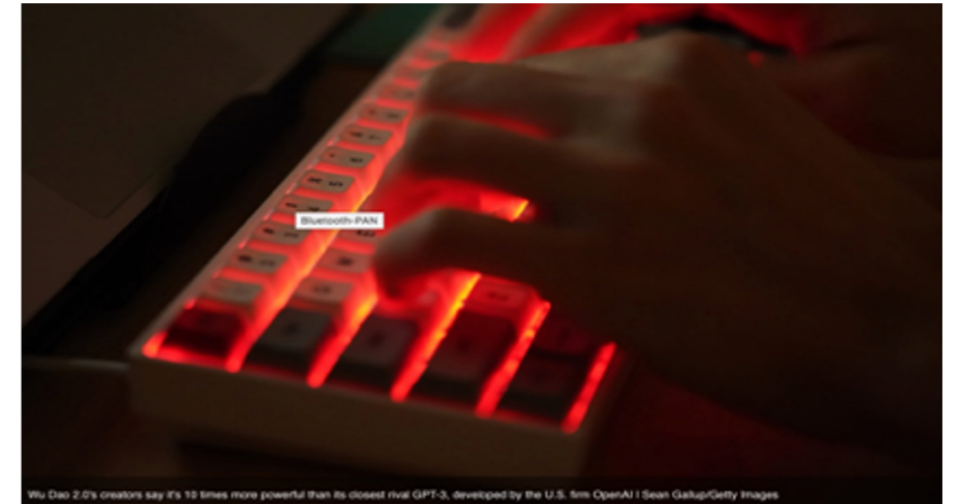

But there's always room for improvement. Language is remarkably nuanced and adaptable. It can be literal or figurative, flowery or plain, inventive or informational. That versatility makes language one of humanity's greatest tools — and one of computer science's most difficult puzzles.

## *Google's Toughest Search Is for a Business Model*

By Saul Hansell

April 8, 2002

As Eric Schmidt prepared the agenda for last September's board meeting of Google, the Internet search company, he added an item "Financing Plans -- prepare for initial public offering."

"I assumed I was brought in to take the company public," recalled Mr. Schmidt, who became chairman of Google in March 2001 after a long career at Sun Microsystems and four years as chief executive of Novell.

By last September Google, which began as a research project at Stanford before raising venture capital in 1999, had earned a reputation as the best way to find things on the Internet. It had the prestige of being the search engine on Yahoo. Traffic to its own Google.com Web site was surging. The company's advertising sales, after a slow start, were starting to catch on. It had just turned a profit.

## RATIONALE I:

### Need for large European AI models & corresponding computing resources

- Innovative strength and competitiveness
- Leading position for Europe in AI development
- Digital sovereignty
- Large AI models according to European values:

OPEN SOURCE

MULTILINGUAL

HIGH DATA  
PROTECTION

TRANSPARENT ALGORITHMS &  
REDUCTION OF BIAS

CO2-NEUTRAL

## **RATIONALE II:**

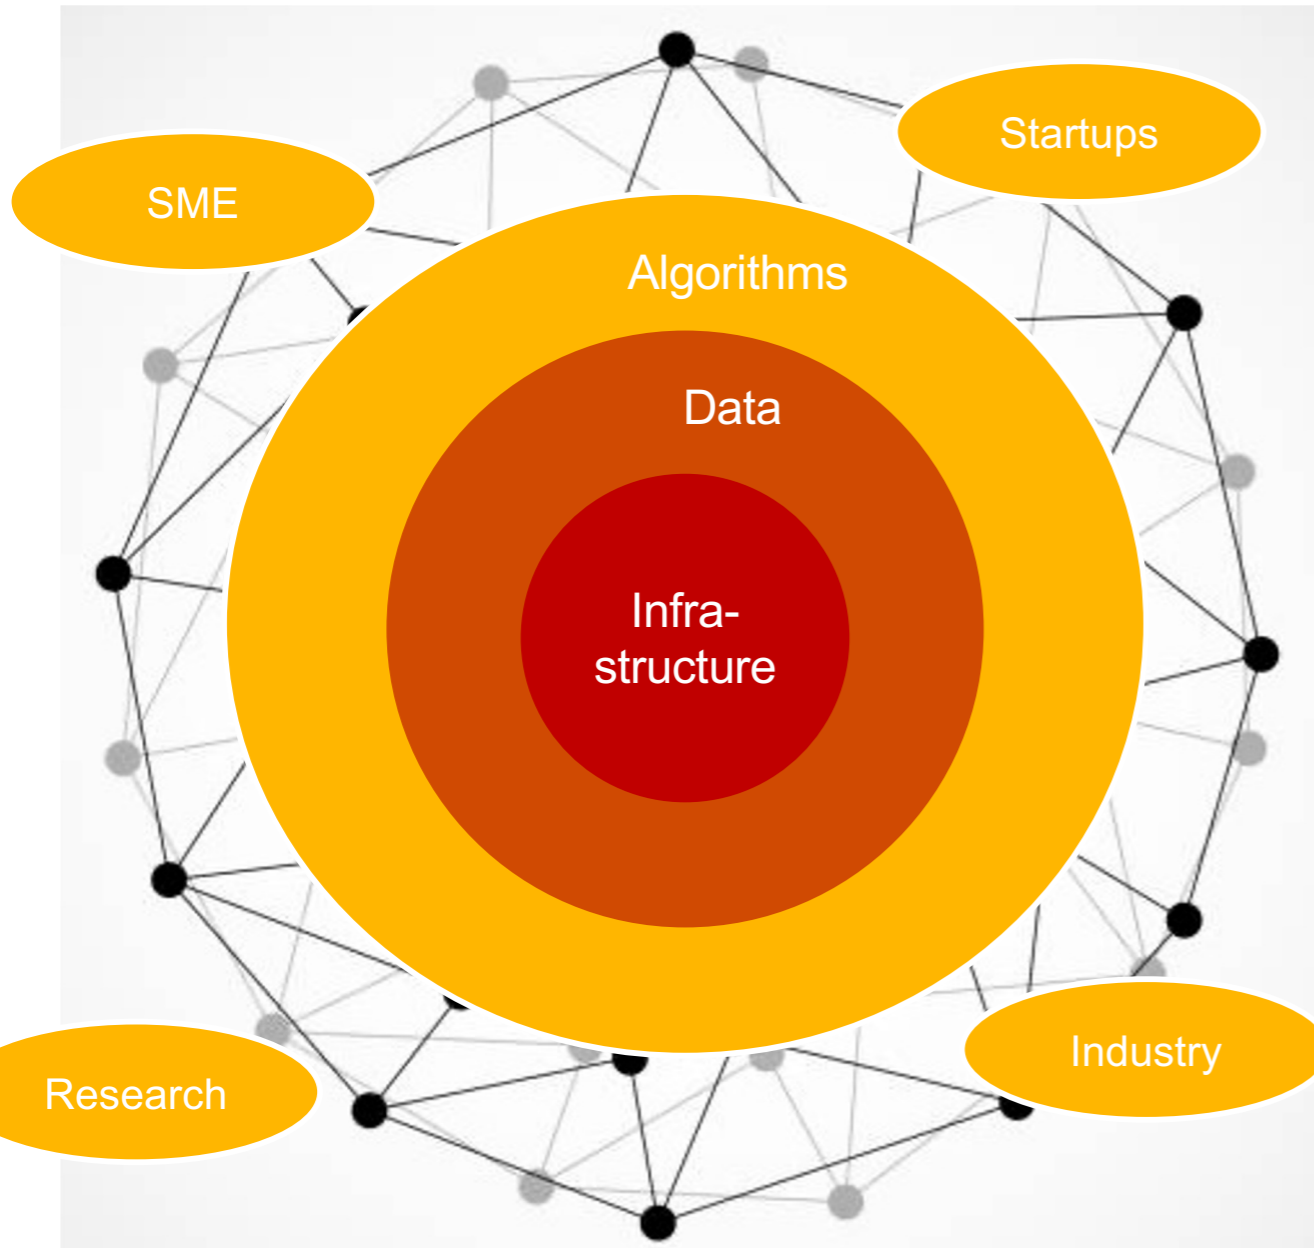

### **Need for large European AI models & corresponding computing resources**

- European AI developers lack available infrastructure specifically tuned for AI development
- Rapid developments in HPC due to constant investment in order not to fall behind
- Competition for coveted HPC computing time in Germany

SOLUTION

**LEAM aims to build large AI models that enable Europe to take on a leading position in AI development**

## Building the capability to train large AI models in 5 steps

Considering European values

- 1 Establish infrastructure
- 2 Collect data
- 3 Develop algorithms
- 4 Integrate into European AI ecosystem

## LEAM – Large European AI Models

A European CERN for AI

Stay informed about our initiative

### What is LEAM?

LEAM is an initiative of the German AI Association (KI Bundesverband), and leading representatives from industry and research that fosters the development of large AI models.

To realize large AI models Made in Europe the initiative proposes **six key steps**:

- Collection and creation of comprehensive training datasets
- Support of excellent research in the field of AI
- Provision of hyperscale infrastructure
- Development of organizational structures and processes to establish a continuous workflow of model development and enhancement
- Integration of the models into the European innovation ecosystem
- Development of methods, benchmark datasets and criteria to ensure ethical requirements and European values

We want the models developed under this initiative to be open source and free to access for all market players. All European languages should be fully integrated into the models.
